Camera

The camera on the iPhone has improved significantly over the years, the best seen on the iPhone 6 and 6 Plus. With new HDR technology and filters, pictures can be manipulated in all sorts of ways.

1. When the camera app is opened, the first screen that will be shown has many different initial options. The large white circle on the bottom of the screen can be pressed to take a picture, but there are many different types of pictures to take. For example, in the top left corner of the screen there is a lightning signal that one can tap to control the flash on the camera. The top right of the screen shows a camera with arrows inside, which can be used to change *which* camera you are using (one is in the front, one is facing towards the user). The HDR auto button is what controls the quality of the pictures. It is best to leave this alone, but if you want you can press this button to make the pictures lack HD-quality.

2. The fourth item on the top of the screen is the photo timer. When you click this, you'll see three different times. Each of these represents a certain number of seconds that will count before the phone takes the picture. This is good for if you don't have anyone to take a group picture and you need to get in it (shown in blue).
3. In the bottom right corner of the screen there are three circles touching each other. If you click these a screen will appear with numerous different filters. You can use these to make your pictures and videos appear differently.

4. Finally, one of the most important aspects of the camera is knowing how to utilize the different types of photography that can be taken. If you look near the bottom of the screen just above the large circle, there will be a word. You can swipe to the left or right of this word to use the many different types of picture-taking methods available on the iPhone. Seen below is slow-motion ("slo-mo"), which records video in slow motion. To the left is time lapse, which

plays long videos over a very short period of time. There is also a regular video function, a square-shaped picture (for Instagram uses), and a panorama, which allows you to take a picture of a surrounding setting.

5. For instruction on sending the photos you take to other people or yourself (on your computer or device), see the “iPhone and iPad” tutorial in the “Online Content” tab on our website.

Overall, the iPhone camera has many different features that make it unique to cell phones on the market. If you happen to own one, you should definitely become acquainted with the many types of pictures you can take. This will not only allow you to capture your best memories, but when it comes down to it, it’s really fun!
